

JOB DESCRIPTION: SOFTWARE ENGINEERING INTERN @ CONTUIT

Are you studying to become a Software Engineer? Have you trained in either .NET or the MERN stack (Mongo, Redux and Node)? Are you excited to join a dynamic startup and work under an experienced US tech founder? Contuit is looking for someone just like you to join our team as an intern!

Who are we, and why should you work for us? Contuit is a 'no-code' automation platform for IT managed service providers ("MSPs"). We recently came out of stealth mode - our platform works with APIs to automate end-to-end workflows between different IT software platforms (like ConnectWise, Cisco and Kaseya), saving countless hours from being spent on boring and repetitive tasks. Our founders come from leadership backgrounds in Amazon and Kaseya and are focused on building out an awesome team to tackle this challenge. We were excited to sign Cisco as an early partner and are already solving problems for multiple IT service providers today – our product is live, but we need your help to turbocharge it as we move into the growth stage! We offer a fully remote work environment, flexible internship scheduling (open to part-time or full-time), a strong and experienced leadership team based in Seattle and New Zealand, and the opportunity to learn a LOT... all while working to change the entire IT industry.

Who are we looking for?: You will work under our experienced CTO (based in Seattle) and alongside an experienced Software Engineer to help drive our software development process from conception to deployment. We are looking for someone with relevant experience who is also an energetic team player, and somebody who is looking to learn fast and help us build something impactful!

Responsibilities

Engineering and Development

- Write reusable, testable, and efficient code, seeking support and assistance where needed
- Assist with Unit and Integration tests to ensure the quality of code
- Address and improve any technical issues
- Be responsive to change requests and feature requests

Continuous Integration and Version Control

- Take end-to-end ownership of changes, testing and release
- Ensure proper version control and change management

Core Requirements:

- Must be studying toward a Bachelor's degree in software engineering or a related field at a leading institution
- Course-based or practical experience with either .NET framework or MERN Scaffolding tools (MongoDB, Express, React, Redux, Node)
- Some experience with unit testing, release procedures, coding design and documentation protocol as well as change management procedures

Nice to have:

- Systems development life cycle (SDLC) experience using Agile or hybrid methodology
- Experience with Git for version control and change management
- Ability to manage tasks independently and take ownership of responsibilities
- Solid knowledge with jQuery and other JavaScript libraries
- Proficiency using debugging tools such as Visual Studio Code
- Experience working with Rest APIs
- Experience working with Azure is a strong plus
- DevOps Monitoring using Grafana and Prometheus
- Experience with modern web/UI development tools and techniques
